

Logica

Cyres has been partnering Logica to deliver analysis and reporting to the Danish Patobank

Patobank collects Pathology data from all hospitals around Denmark. They asked WMDData (now part of Logica) to provide an online solution for these hospitals that would deliver a wide range of analysis and summary reports. This was a real challenge as the data sets are huge and the reports were very complicated.

Logica turned to Cyres for help as we have so much experience in analysing and reporting medical data. The first version was released over 2 years ago and exceeded their expectations.

The solution enables hospitals to analyse their own data online through a range of prebuilt reports as well as build their own searches and reports. As a result they can now check sensitivities, specificities, positive predictive values, false negatives, inadequate rates etc.

Cyres demonstrated that they had the technologies, skills and expertise to interpret a complex brief, and deliver a highly effective system with a clear and simple interface. On top of this all the data and dashboards are in Danish!

The second version, incorporating all sorts of new reports, has just been released and is now live.

These are all delivered through online dashboards - another highly successful solution built around sixW.
